Zero linking number does not mean a split pair

For a split union: $V(K_1 \sqcup K_2) = (-A^2 - A^{-2})\, V(K_1)\, V(K_2)$.

The exact coefficients below violate this identity in every witness.

Integer coefficients are computed exactly from planar diagrams. The additional outer coefficients alone exclude a split union. Agreement across precision, sampling density and projections is recorded alongside the complete polynomials.

Each comparison uses the actual knot polynomial of each component. This avoids mistaking individually knotted but separated curves for a mutually linked pair. Equal polynomials would be inconclusive; here they are unequal.
