Coexisting attracting motions can form a non-split link

Three numerical witnesses. Two discovery routes: overlapping families and symmetry breaking.

S02 + S08

S01 daughter + inversion partner

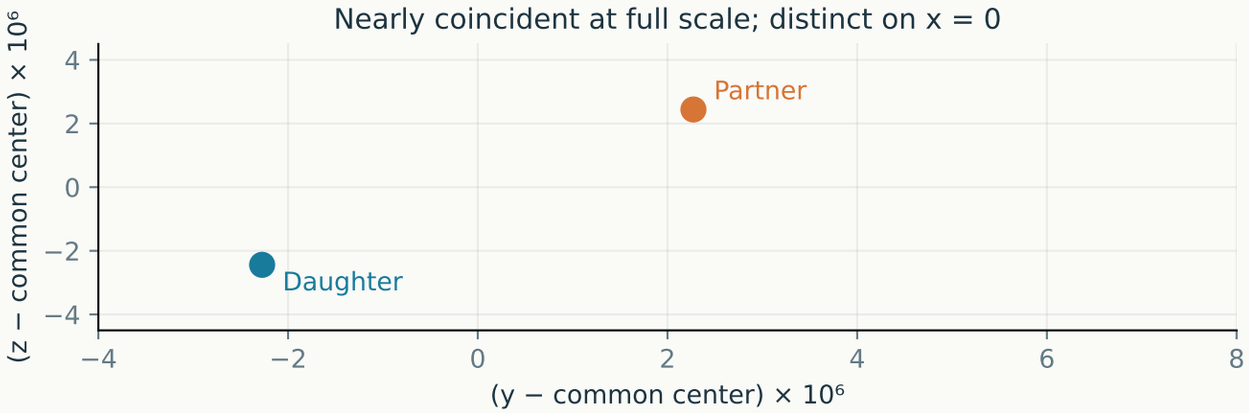

Different motions, one set of parameters

Periods: 28.22965 and 10.84575

Both attracting; both individually inversion-symmetric.

Gauss linking number = 0

Exact joint Jones polynomial ≠ split-union polynomial

Every portrait preserves the shared state-space coordinates. The section close-up uses one common translation and scale.
Left: α = 8.94, β = 14.26071457889439. Right: α = 9, β = 14.25984090319409. Full slopes and certificates are in the report.

Exact interval checks certify the attracting cycles. Linking is supported by refined numerical curves and exact diagram invariants; an ambient-isotopy certificate connecting each polygon to its exact ODE orbit remains open.
