A long motion can organize still longer motions

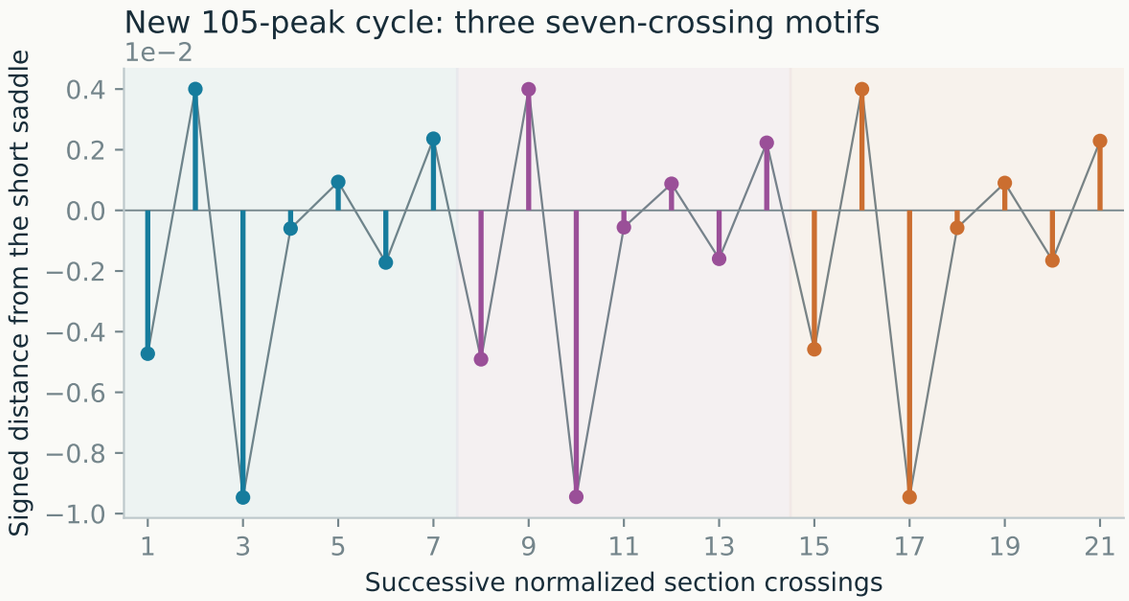
One additional level tested in two Chua families; arbitrary depth remains unproved.

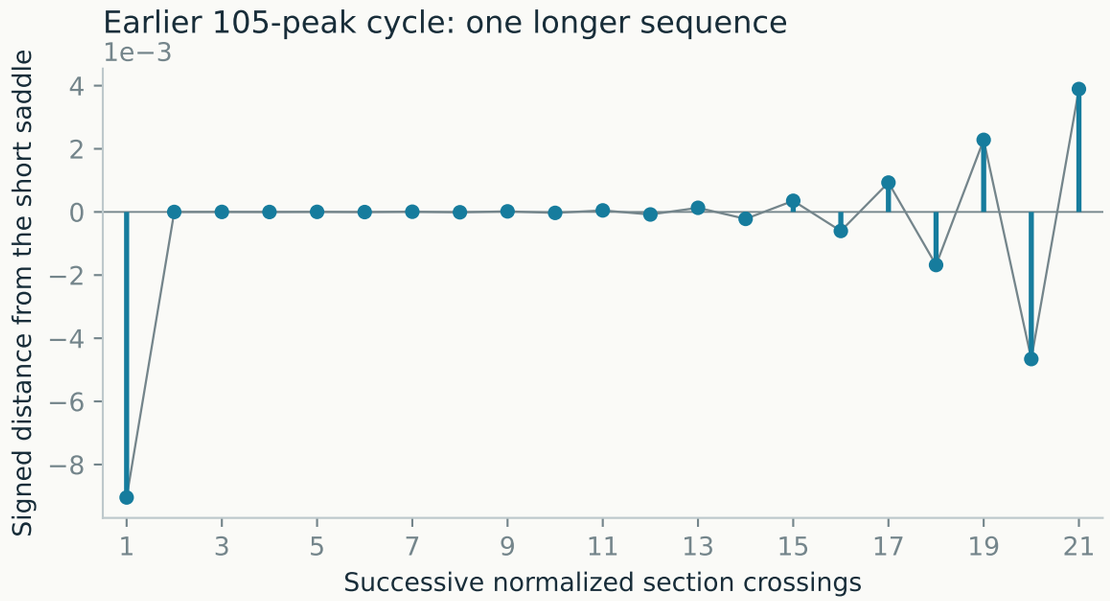
5-peak short cycle → 35-peak family → 105 / 175 / 245 peaks

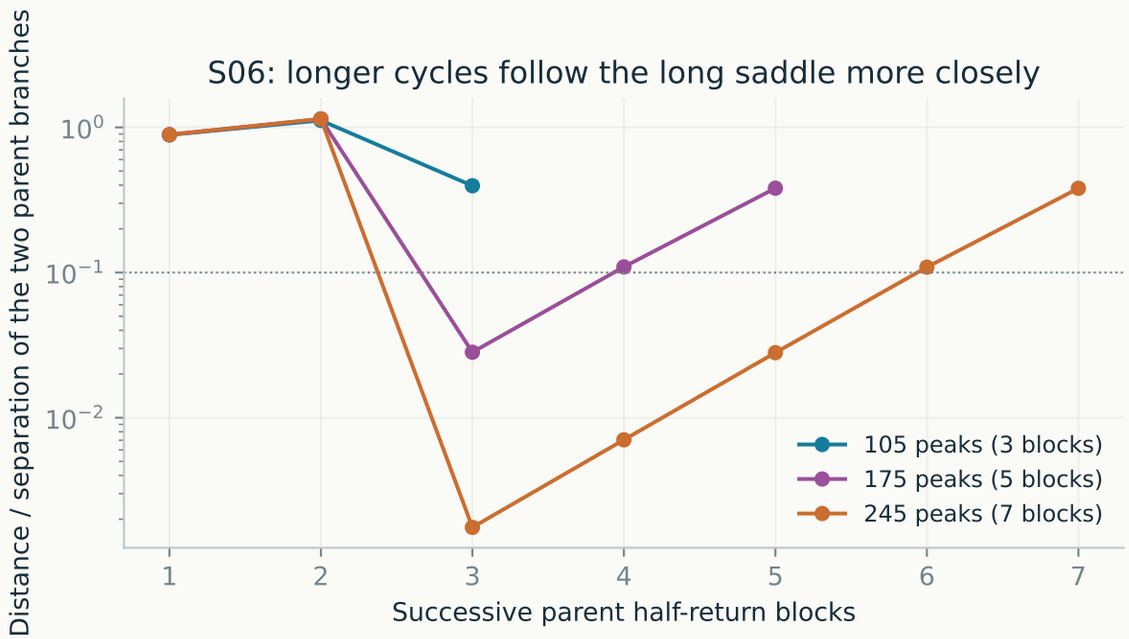
Earlier first-level sequence

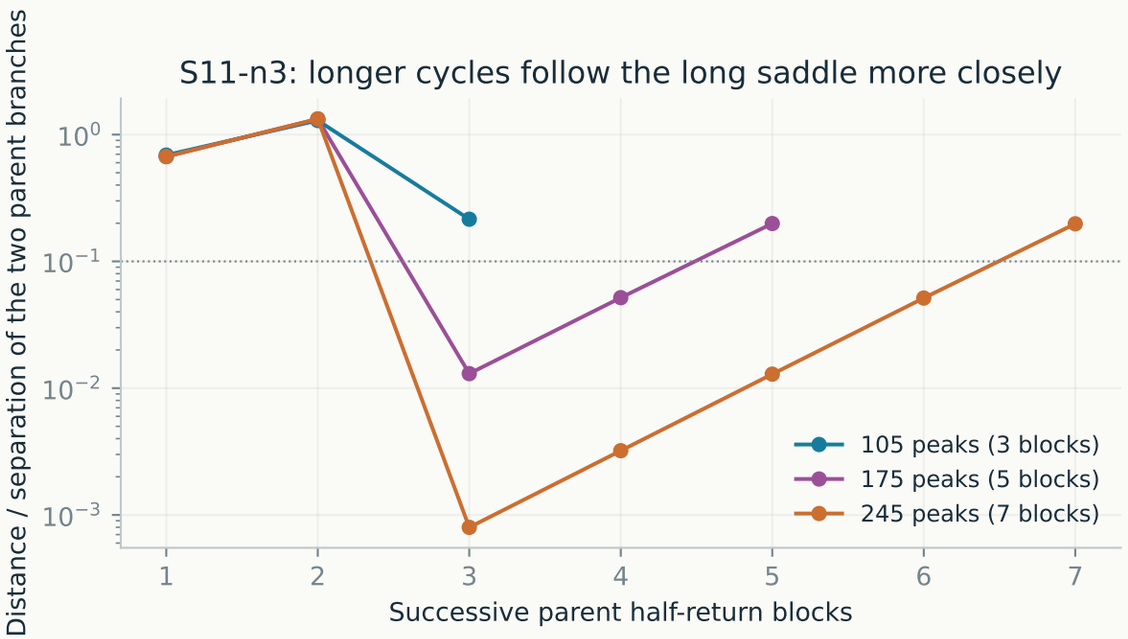
Continue through its fold to a saddle

New cycles revisit that long saddle









Upper panels: each orbit uses its own same-parameter short saddle. Lower panels: each block compares all seven section points.
The dotted 0.1 level is a display guide, not an acceptance threshold. The figures show measured orbits, not an infinite construction.
