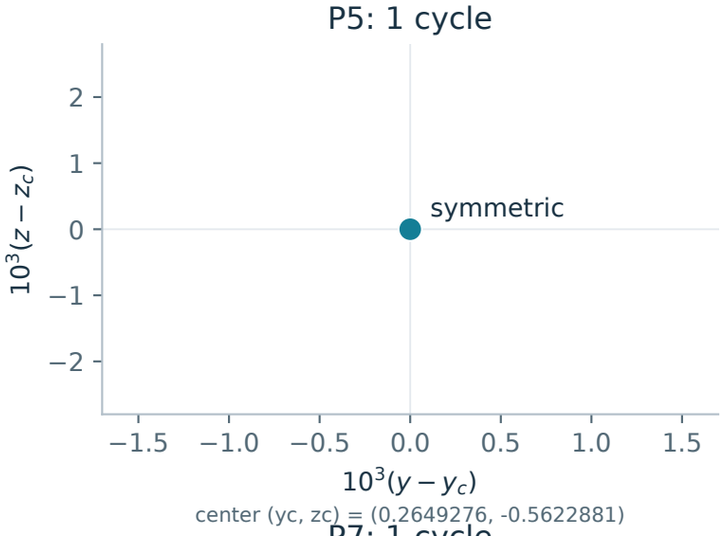
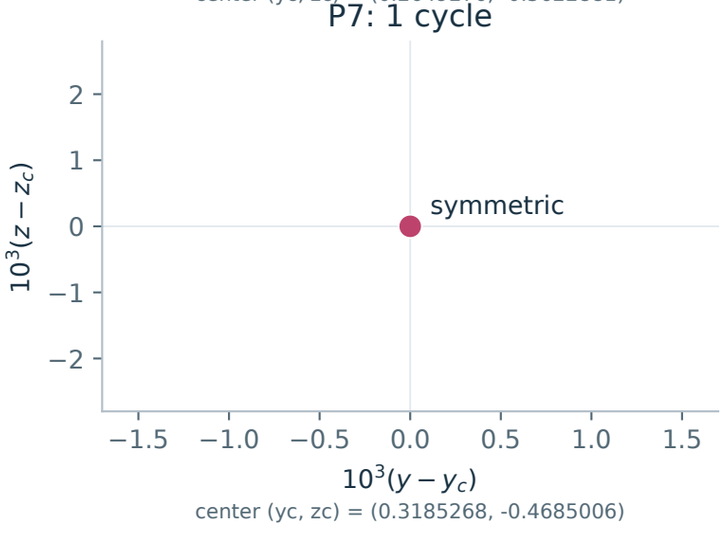
A section makes the distinct cycles visible

Recorded upward crossings of x = 0. Each panel is centered on its own family; all panels use the same scale.

2 checked cycles at this point

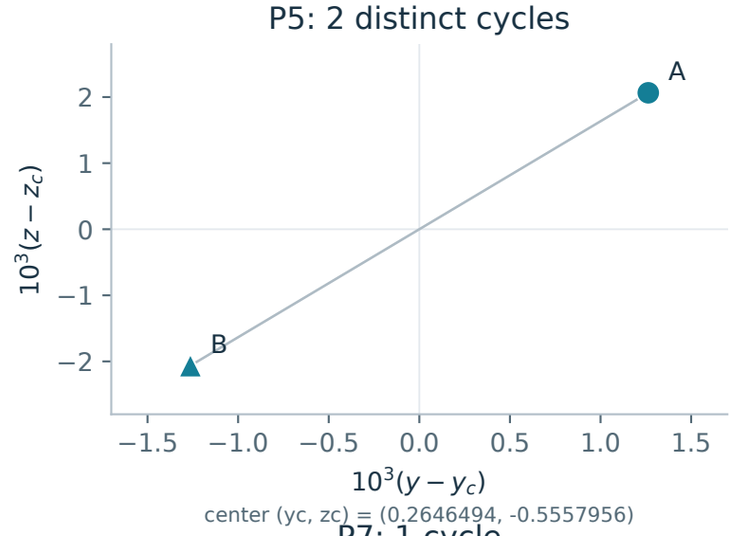


center (yc, zc) = (0.2649276, -0.5622881)

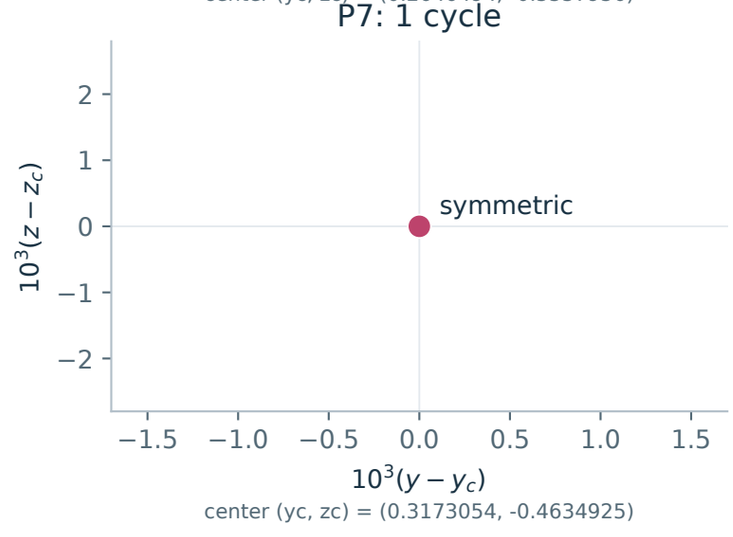


center (yc, zc) = (0.3185268, -0.4685006)

3 checked cycles at this point

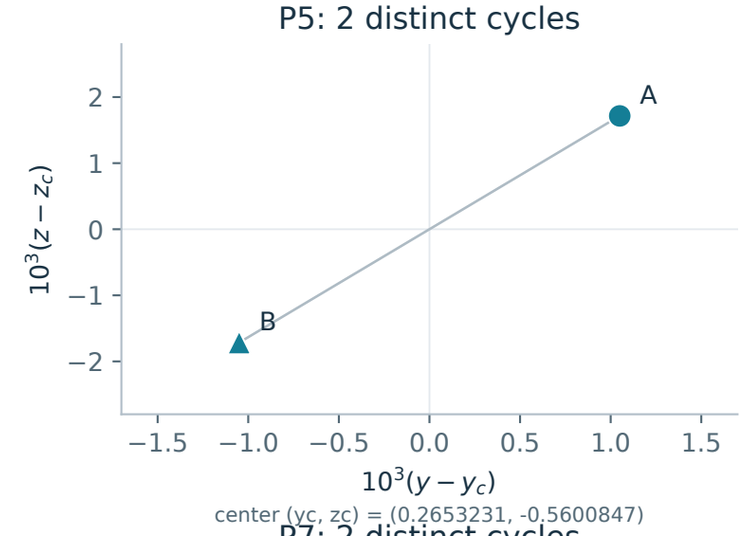


center (yc, zc) = (0.2646494, -0.5557956)

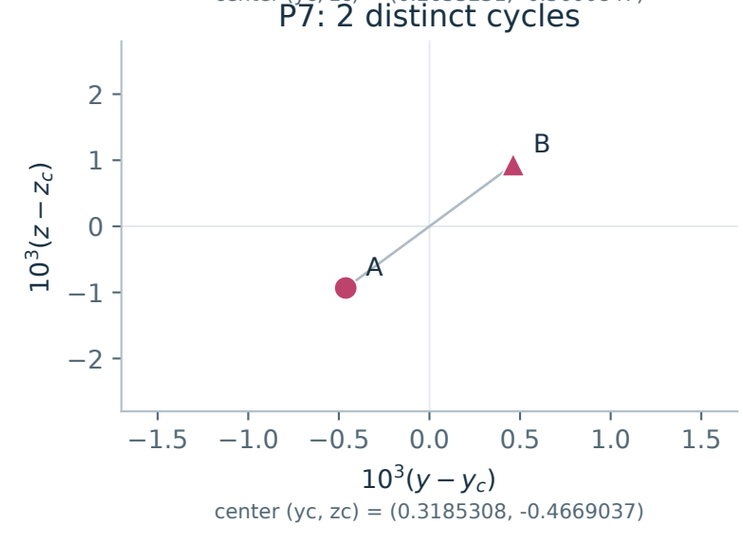


center (yc, zc) = (0.3173054, -0.4634925)

4 checked cycles at this point



center (yc, zc) = (0.2653231, -0.5600847)



center (yc, zc) = (0.3185308, -0.4669037)

The nearly overlapping 3D curves separate into distinct points on the section. A and B are related by state inversion and a phase shift.
Centers are printed so the original section coordinates can be recovered. These are orbit points, not basin samples.
