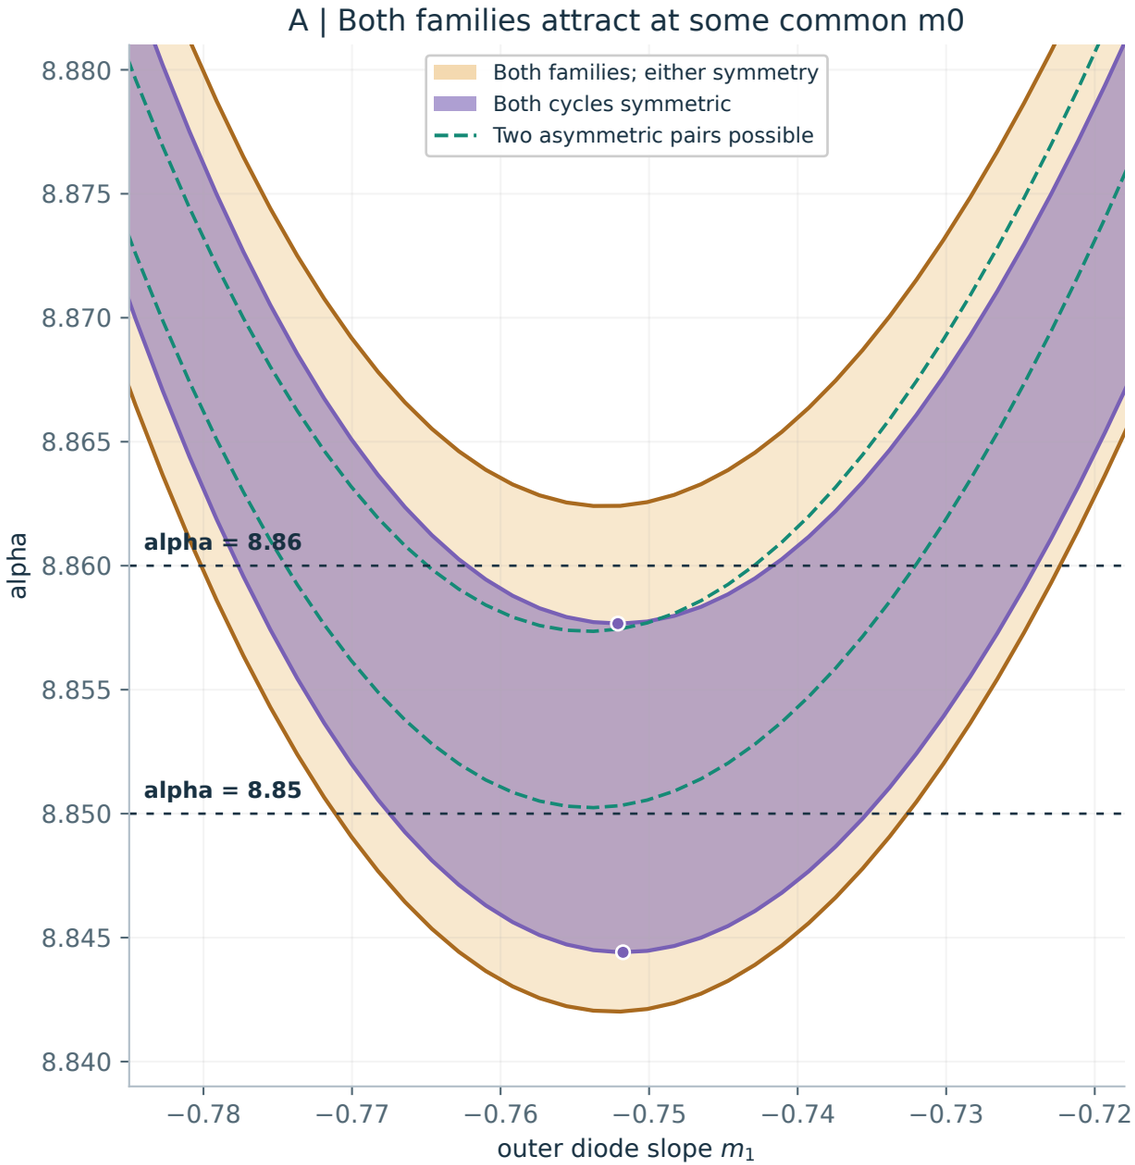
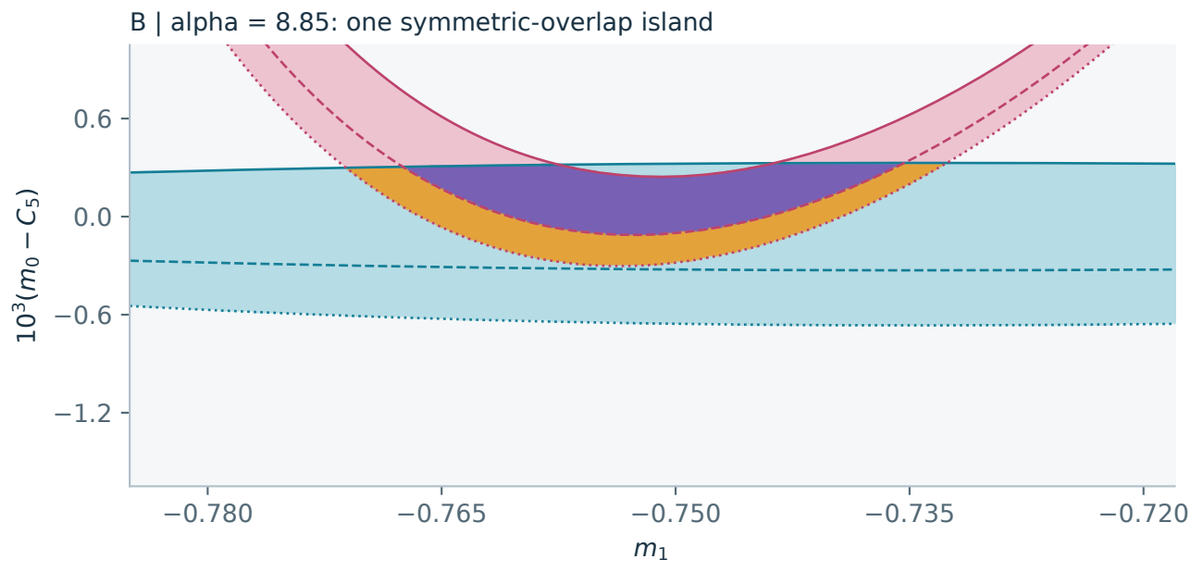
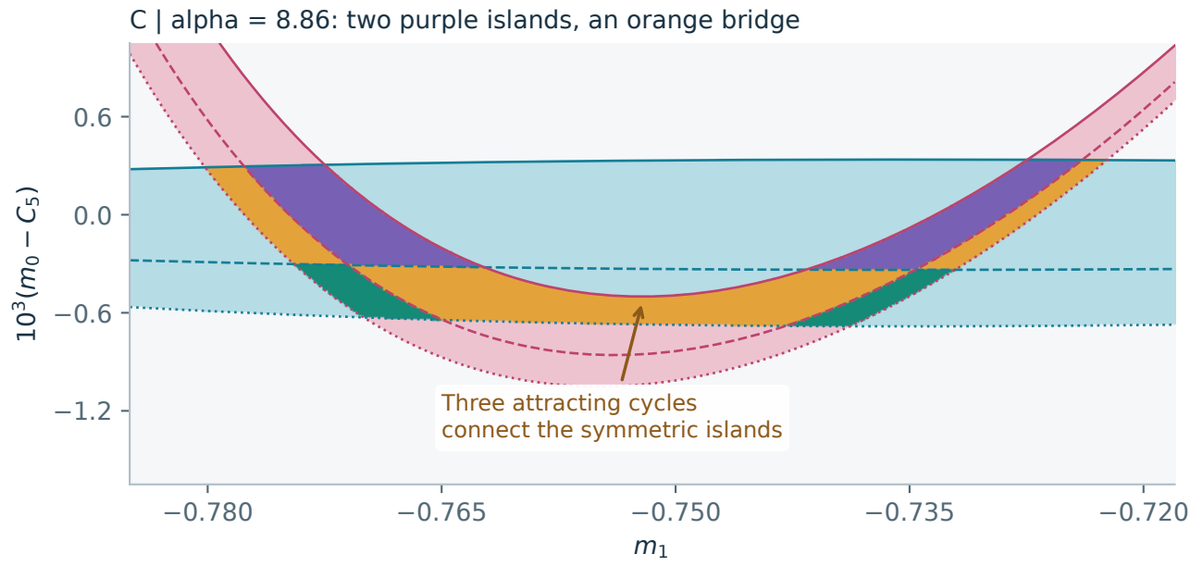
# Symmetry changes the apparent layer count

A numerical atlas of two Chua families: five and seven peaks per full period.  beta = 100/7.







P5 only
P7 only
2: one symmetric cycle each
3: one pair + one cycle
4: two asymmetric pairs

Right: subtracting C5 = (fold5 + symmetry5)/2 straightens P5; vertical interval widths are preserved.
Counts include these primary cycles before their first period doubling. White does not mean chaos or absence of other attractors.
