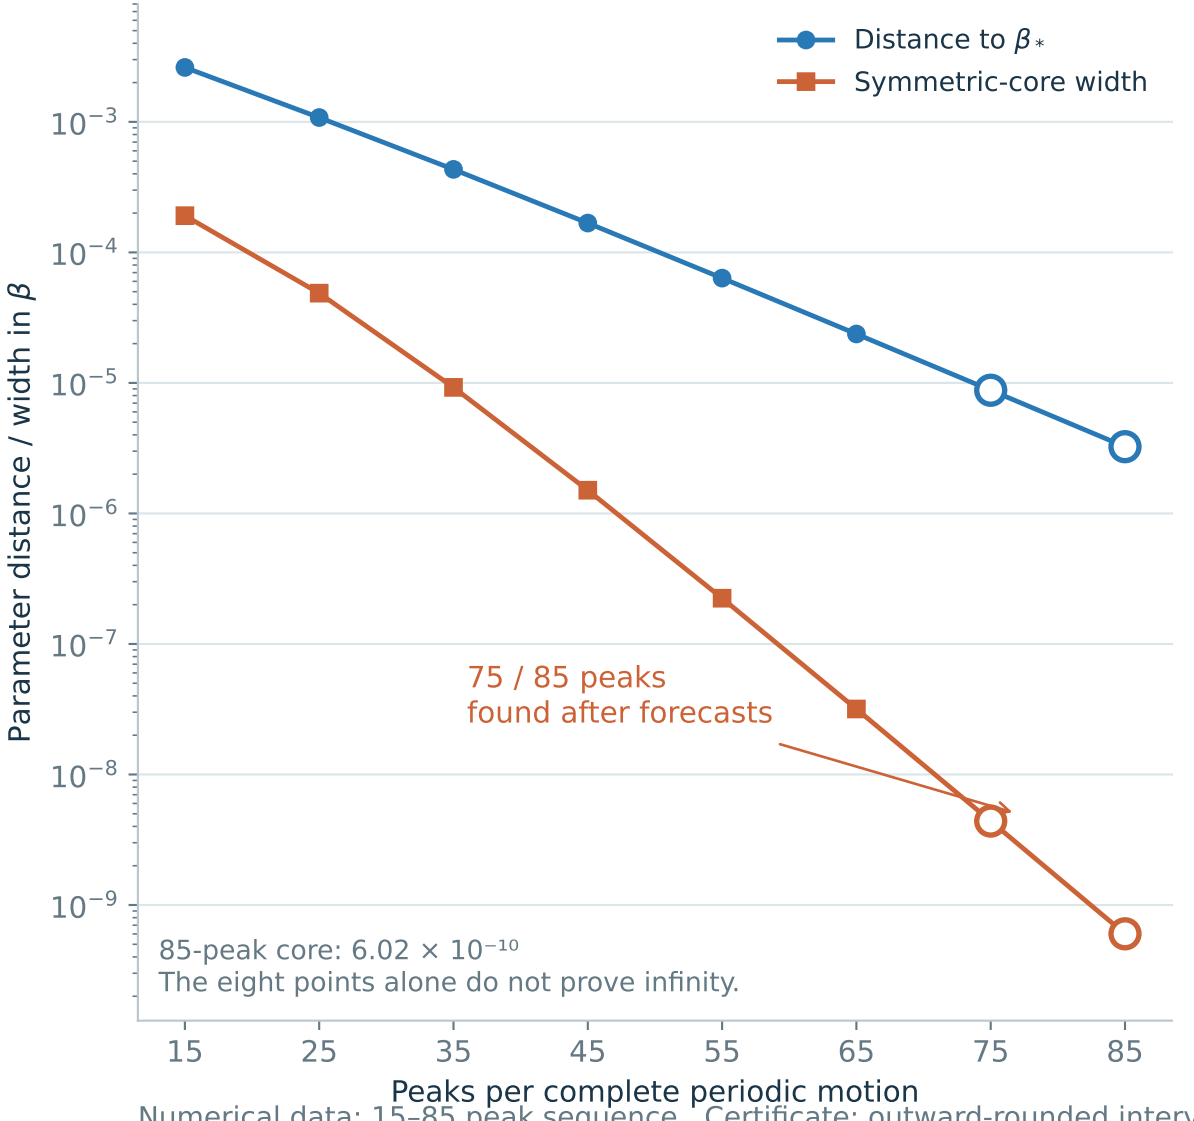
An infinite cascade in the Chua parameter atlas

$\alpha = 9, \quad m_0 = -8/7, \quad m_1 = -5/7$ | Measured windows and a certified organizing tangency

A Eight measured members



B The interval certificate

Exact invariant manifolds
Graph bounds include curvature and parameter motion.

Quadratic contact
$g_{aa} \in [2.0956,\ 2.1447] \times 10^{13}$

Transverse unfolding
$g_\beta \in [3.3728,\ 3.3731]$

Dissipative saddle
$|\det DP| < 2.788 \times 10^{-9}$

C Consequence of the sink-cascade theorem

Infinitely many attracting windows with increasing return periods

They accumulate at a certified contact near

$\beta_* \approx 14.30635909996146$

Numerical data: 15–85 peak sequence. Certificate: outward-rounded interval inequalities.
Infinity concerns windows at different parameters; the total number of connected 3D surfaces is not determined.
