One argument, three kinds of evidence

Chua tangency certificate · coexistence audit · first formal proof

1 NUMERICAL CERTIFICATE

Actual Chua return map
80 and 100 digits: all 15 gates pass
Two shifted boxes: both rejected
135 transverse flights per connection

2 LEAN-CHECKED IMPLICATION

Arbitrary continuous gap g(a, b)
Four face signs + actual derivatives
⇒ an interior g = 0 and g_a = 0
Also: ten exact rational guards

3 CLASSICAL THEOREM

Newhouse–Robinson
Applies within a fixed parameter family
Can give infinitely many sinks
at a single parameter value

FORMALIZATION STILL TO CONNECT

The interval evaluator and exact invariant manifolds
are not encoded in Lean. The general theorem checks
the logical implication once its hypotheses hold.
No theorem about Chua is assumed inside the proof.

COEXISTENCE STEP STILL TO CLOSE

Show that the theorem-generated sinks remain inside
the valid Chua return domain. A compact extension alone
is insufficient without that confinement argument.
Infinite coexistence remains conditional here.

New formal observation Convexity is not needed for existence of the stationary zero.

This is an argument map, not a plot of infinitely many computed attractors.
