Four coexisting Chua cycles: no joint link found

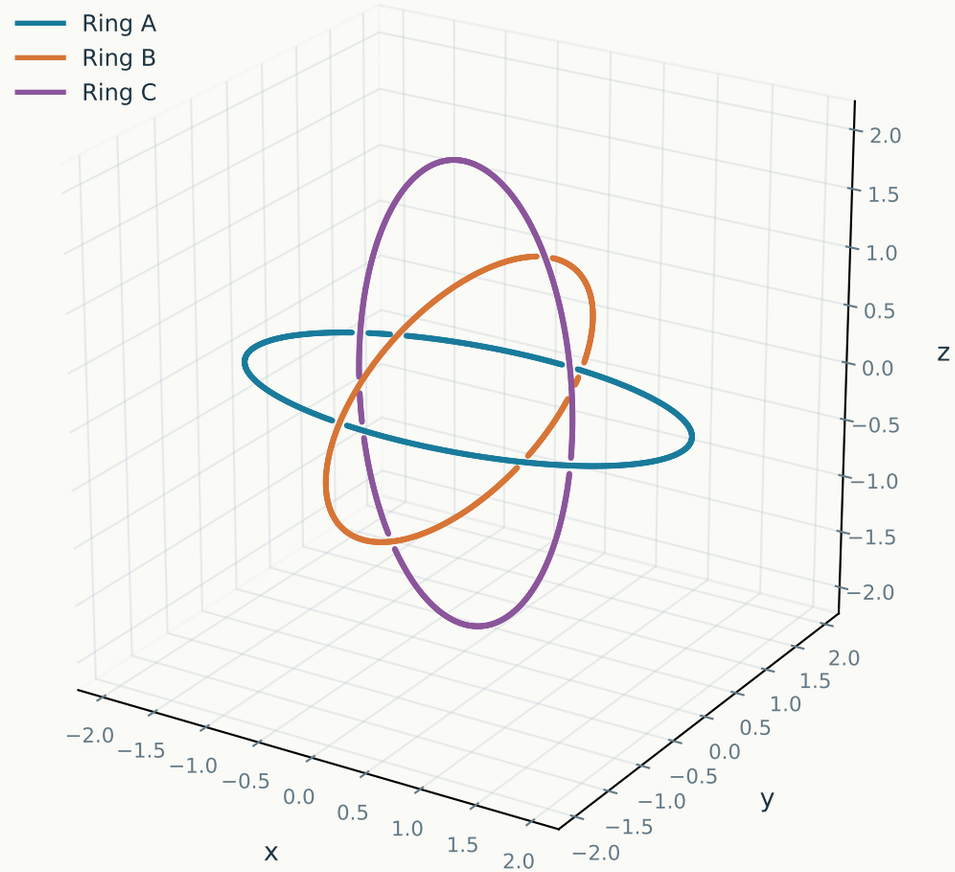

Actual cycles at one parameter point, compared with a known collective-link control.

Chua: four numerically unlinked components

Individual cycles	**4 / 4 unknots**
Two-cycle sublinks	**6 / 6 unlinks**
Three-cycle sublinks	**4 / 4 unlinks**
All four together	**Unlink**

Control: Borromean rings

Individual rings	**3 / 3 unknots**
Two-ring sublinks	**3 / 3 unlinks**
All three together	**Nontrivial link**
Detection	**Exact diagram polynomial**

Chua: α = 453/50, β = 71729/5000, m_0 = −8/7 + 3/500, m_1 = −5/7, γ = 0.
Each panel uses shared coordinates; small gaps mark undercrossings in this projection. Projection overlap is not linking.
Classification concerns reconstructed polygonal curves; ambient isotopy to the exact ODE orbits is not certified.
