Five knot types among 34 reference cycles

Numerical classification of attracting periodic orbits · $\alpha = 9$, $m_0 = -8/7$, $m_1 = -5/7$ · β varies by family

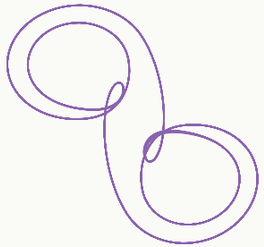

P85 · 85 peaks
23 reference cycles

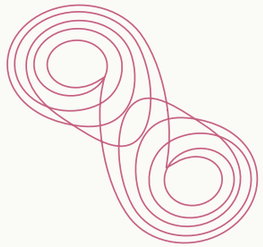

A04 · 25 peaks
1 reference cycle

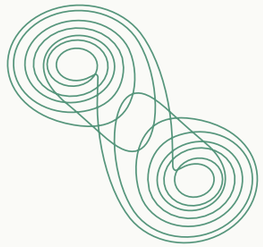

A05 · 30 peaks
1 reference cycle

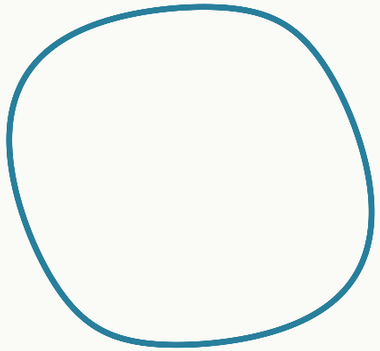

S01 · 9 peaks
2 reference cycles

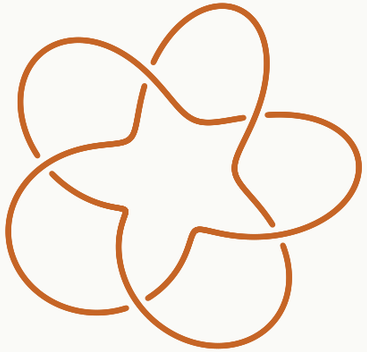

E01 · 13 peaks
7 reference cycles

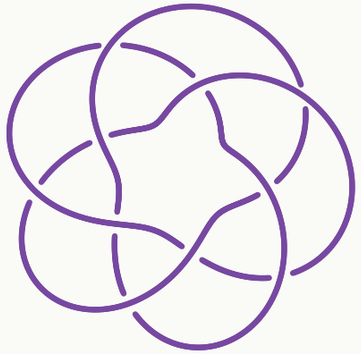

Unknot

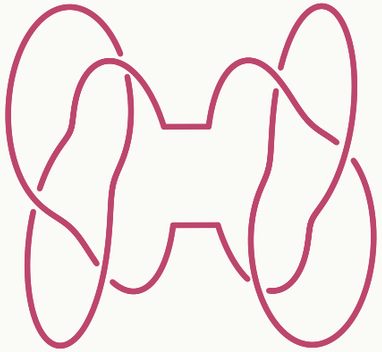

T(2,5)

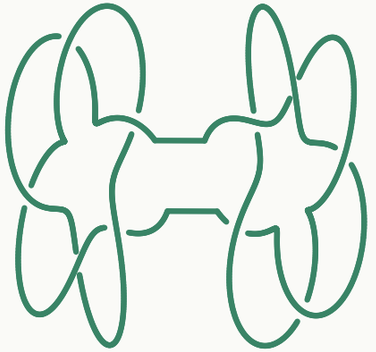

Mirror of T(3,5)

Square knot

T(2,5) # mirror

TOP Actual Chua orbits; coordinates rescaled independently. BOTTOM Standard embeddings of the identified knots.

The 15 → 25 → … → 85 peak sequence is unknotted in all eight tests. More peaks do not imply a more complicated knot.
