A local boundary between two Chua attraction basins

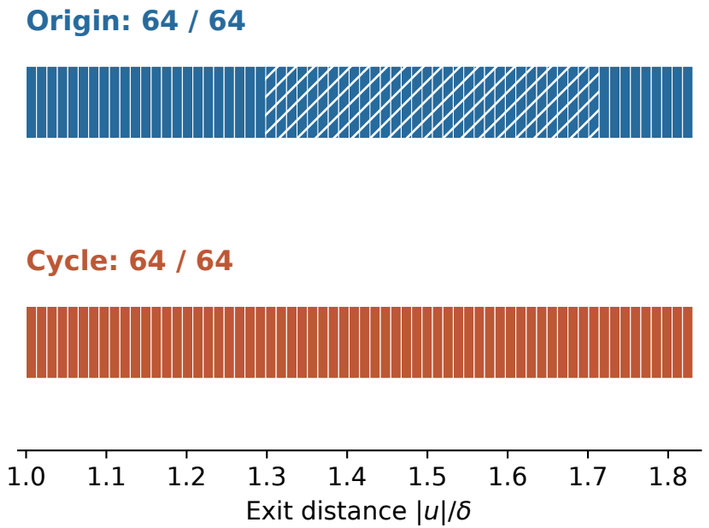

$\alpha = 8.4,\ \beta = 12,\ m_0 = -0.95,\ m_1 = -0.05$ | Interval coverage at 80 and 100 digits

A Certified local square

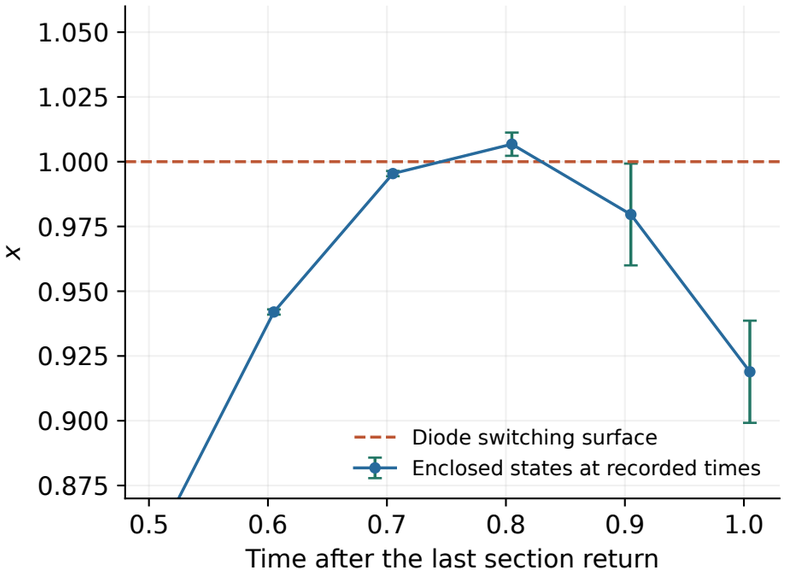

$\delta = 10^{-7}$; stable-graph slope ≤ 0.02

B Whole strips, not sampled starts

Hatching: continuous flow across diode contact.
Each rectangle includes the entire stable-coordinate range.

C Passing through the contact

Error bars enclose whole sets at the marked times.
Picard tubes certify the intervals between them.
