New crossings do not imply a new attractor

P7: 8 → 12 breakpoint crossings; 7 peaks throughout; dominant multiplier magnitude 0.181–0.1856

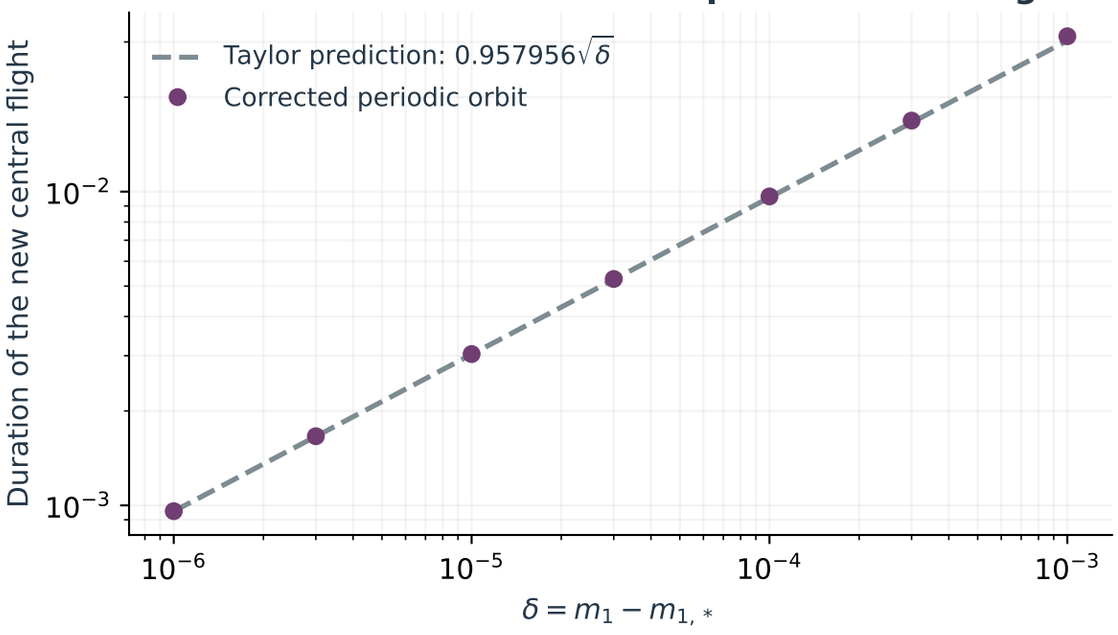

The same seven-peak motion persists

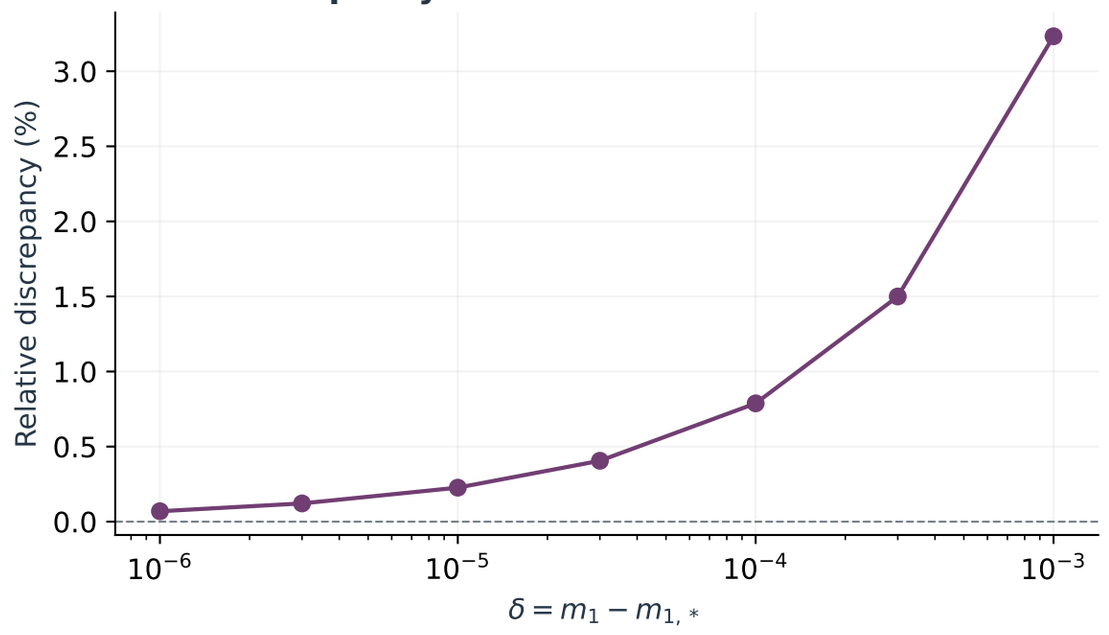

A short central flight appears at the contact

Predicted and measured square-root scaling

Discrepancy falls to 0.0694% near contact

A fixed smooth parameter line crosses the contact at m1 = −0.655374411697. DOP853 and Radau check the actual field.
The analytic comparison follows preliminary exploration; it is not a blind forecast. The unsuccessful first protocol is retained.
